

CHAPTER 1

Overview Of Renal Biopsy In Malaysia

Lee Ming Lee
Lily Mushahar
Lee Day Guat

1.1: Introduction

The Malaysian Renal Registry of Renal Biopsy (MRRB) was introduced in 2005 to provide information on the incidence and prevalence of glomerular disease in Malaysia. Data submission includes both paediatric and adult renal biopsies performed from participating centres.

In the 1st MRRB Report 2007, the participating centres were only from the Ministry of Health (MOH) hospitals. The private, army and university hospitals participated in data submission from year 2008 onwards.

This 5th MRRB Report shows data for renal biopsies done in year 2011-2012. Data for year 2005-2010 were included for comparison in the report.

1.2: Type of renal biopsy performed

1.2.1: Ascertainment rate of total biopsy performed

A total of 45 centres participated in this MRRB report; 23 (15 adult and 8 paediatric) Ministry of Health (MOH) hospitals, 3 Universities, 1 army hospital and 18 private hospitals. All participating centres were identified by their individual source document provider (SDP) number. Although there were no new centres reporting to MRRB since 2010 the total number of biopsies performed had increased from 1538 in 2010 to 1733 in 2011 and 1761 in 2012 (Table 1.2.1).

It is encouraging to note that there appeared to be also a progressive improvement in the ascertainment rate. The average ascertainment rate for 2005-2010 was 72.1% while the ascertainment rate for 2011 was up to 90% and further increased to 95% in 2012.

1.2.2: Type of renal biopsy performed

The majority of biopsies reported were from native kidneys; 88% (from 2005-2010), 86.2% in 2011 and 83.5% in 2012 (Table 1.2.2). There was also a slight increase in trend of the total number of graft biopsies being done over the last 3 years.

1.2.3: Number of native renal biopsy performed on each individual patient (by number of episodes) 2005-2012

From 2005-2010, a total of 5428 patients underwent native renal biopsy. For 4711 (86.8%) patients, it was their first renal biopsy, while 577 (10.6%) patients had biopsy done twice, 119 (2.2%) done thrice and 21 (0.4%) underwent biopsy 4 times or more. In 2011 and 2012, the figures were quite similar for both years where majority (about 85%) of the patients underwent biopsy for the first time. About 12% underwent biopsy twice and less than 4% underwent biopsy more than twice (Table 1.2.3(a)).

For graft biopsies (Table 1.2.3(b)), the percentage of patients who underwent multiple renal biopsy were higher compared to native biopsies. In year 2011 and 2012, about 50% of the patients had graft biopsy done once, 30% done twice and 20% required 3 or more biopsies. There appeared to be more repeat graft biopsies in 2011-2012(52%) compared to the 2005-2010 period (42%).

1.2.4: Demographic distribution of renal biopsy (Native and Graft)

1.2.4.1: Age distribution

About two thirds, (66%) of the native renal biopsies were done in the age group 15-45 years. Paediatric patients less than 15 years contributed to about 14% of the native biopsies. Very few biopsies (8.6%) were done in patients older than 55 years of age (Table 1.2.4.1(a)).

In graft biopsies, majority (86%) of the biopsies were done in the age group 15-55 years of age. Very few graft biopsies were from the extreme age groups; 4.2% in the <15 years and 11.4% in those above 55 years of age (Table 1.2.4.1(b)).

For adult patients (age > 15 years) the highest number of renal biopsy were reported in WP KL (26.7%), followed by Selangor (22.4%) and Penang (9.9%). In the paediatric age group (<15 years), the highest number of renal biopsy were reported in Wilayah Persekutuan KL (27.2%) followed by Johor (19.9%) and Selangor (16.4%) (Table 1.2.4.1(c)).

1.2.4.2: Gender distribution

As in the previous years, more females underwent native renal biopsy (Table 1.2.4.2(a)). This is probably due to the higher number of females amongst patients biopsied for SLE. However in the graft biopsy group, this was reverse with more males (Table 1.2.4.2(b)). This is consistent with the trend of male predominance amongst the transplant patients as reported in the 20th Malaysian Dialysis and Transplant Registry.

Table 1.2.4.2(a): Gender distribution of native renal biopsy, 2005-2012

1.2.5: Renal Biopsy Report Analysis

A total of 9952 renal biopsies were performed and reported from 2005-2012. Seven thousand four hundred and thirty six (75%) of the biopsies were adequate ie had ≥ 10 glomeruli as defined by our pathologist. Two thousand three hundred and ninety eight or almost 24% yielded less than 10 glomeruli. One hundred and eighteen (1.2%) biopsies were classified as missing because the histopathology reports were not submitted to MRRB (Table 1.2.5).

Table 1.2.5: Number of glomeruli obtained at each biopsy by centres, 2005-2012

1.2.6: Histopathology specimen distribution to histopathology laboratories

As shown in Table 1.2.6 and Figure 1.2.6 (a & b), not all biopsies performed at the centres were read by the local histopathologists. A number of renal biopsy specimens were sent to other centres for processing and reporting.

Table 1.2.6(a): Distribution of biopsy specimens to histopathology laboratories by participating centres, 2005-2012

1.3: Native kidney biopsy

1.3.1: Clinical Indications of renal biopsy

Table 1.3.1(a) shows the main indications for native renal biopsies in 2005-2012 were nephrotic syndrome (40.9%), asymptomatic urine abnormality (28.6%), nephrotic-nephritic syndrome (9.6%) and nephritic syndrome (8.1%). This trend had remained the same over the last 8 years.

Almost half (50.1%) of the patients had normal renal function at the time of biopsy while 37% had impaired renal function. For the remaining 13% data was not available or unknown (Table 1.3.1 (b))

Table 1.3.1(a): Indications for native renal biopsies, 2005-2012

1.3.2: Histopathological Diagnosis

In the native kidney biopsy group; 3 most common primary glomerulonephritis (GN) reported were minimal change disease (33%), focal segmental glomerulosclerosis (FSGS) (30.8%) and IgA nephropathy (20.5%). Membranous nephropathy contributed 8% of the total primary GN subgroup (Table 1.3.2)

Lupus nephritis was the commonest secondary GN diagnosis; accounting for almost 80% of cases followed by diabetic nephropathy (11.2%).The most common tubulointerstitial disease reported was acute tubular necrosis (40.3%). These figures were quite similar to the previous reports .

1.3.3.2: Histopathological diagnosis in patients with urinary abnormalities

In patients presenting with asymptomatic urinary abnormalities; lupus nephritis was the commonest histopathology (42.6%) followed by IgA nephropathy (15.5%) and FSGS (9.6%) (Table 1.3.3.2).

Table 1.3.3.2: HPE diagnosis in Patients presenting with Asymptomatic Urine Abnormalities, 2005-2012

Type	Histopathological Diagnosis	n	%

1.3.3.4: Histopathological diagnosis in patients with nephritic syndrome

In patients presenting with acute nephritic syndrome, the commonest GN was lupus nephritis (41.2%) followed by IgA nephropathy (9.2%) and FSGS (7.9%). Post infectious GN contributed 7.6% of this group.

Table 1.3.3.4: HPE diagnosis in Patients presenting with Nephritic syndrome, 2005-2012

Type	Histopathological Diagnosis	n	%
Primary GN	Minimal Change	43	6.2
	FSGS	55	7.9

1.3.3.5: Primary GN according to various age group

FSGS (39.4%) was the commonest GN in the <15 years age group followed by minimal change disease (37.7%). This may be attributed to steroid resistant nephrotic syndrome as the main indication for biopsy in children. . Meanwhile, the commonest GN in the age group 15-<25 years were minimal change disease (43.5%) followed by FSGS (27.9%).

Among adults age 25-55 years old, FSGS (29%), minimal change disease (26.4%) and IgA nephropathy (25.8%) were the 3 commonest GN. In patients >55 years of age, the commonest GN was FSGS (31%) followed by membranous nephropathy (24.6%) (Table & Figure 1.3.3.5).
